

Project

Survey Builder: Create an application that allows the user to input their response to a form surveys. Use reactive forms to manage complex form structures, including conditional questions and validations.

Form Builder Interface: Allows users (survey creators) to design surveys. This includes adding, editing, and organizing questions of different types (multiple choice, text input, rating scale, etc.). The interface would also enable setting up conditional logic (e.g., if Question 1 is "Yes," then show Question 2).

Validation Rules: Creators can define validation rules for each question, such as mandatory fields, character limits for text inputs, or specific number ranges for ratings.
